

# How to Make Your READY FOR RESCUE

*When seconds could mean the difference between life and death for a sudden cardiac arrest (SCA) victim, be sure your automated external defibrillator (AED) is visible, easily accessible and maintained, just like a fire extinguisher.*

## PLACE IT

Placement of the AED should be centralized in your facility or in an area where the most people gather at any given time. The goal is to deliver a shock to an SCA victim within 3 minutes or less from collapse. Consider installing next to or near a fire extinguisher. Never lock an AED in an office or closet.

## HANG IT

Mount your AED in a wall cabinet or bracket approved for such purpose so the AED readiness indicator faces outward. Never lock the cabinet. If it's a mobile AED, keep it visible on the sidelines during games and practices.

## REACH IT

Be sure your AED is installed at an unobstructed maximum height of 48 inches from the floor in compliance with the American Disabilities Act.

## MAP IT

Add your AED location(s) to site maps that show fire extinguishers and exit routes, and place site maps around your facility.

## SPOT IT

Use projecting (3-dimensional) universal AED signage above the wall cabinet or bracket to make your AED visible. Add stickers to outer doors to show an AED is in the facility.

## CHECK IT

Designate a person in your facility to perform regular AED status checks as indicated by the manufacturer and track electrodes and battery expiration dates and device warranty for timely updating. Check that your rescue kit has the essentials (nitrile gloves, barrier mask, medical scissors, razor, antiseptic wipes, absorbent towel and biohazard bag).

## REGISTER IT

With the AED manufacturer, it may extend the warranty. Follow the manufacturer's maintenance recommendations and consider subscribing to an AED management program. The free National AED Registry will send email reminders for battery and electrodes expiration dates as well as recall alerts when you register it. Be sure to comply with city, county or state registration requirements.

## PROMOTE IT

AEDs are effective when everyone in your facility knows where it is and that anyone can use it. They are designed for the public, so be public about it.

## USE IT

SCA leads to death in minutes if the person does not get help right away. Survival depends on people nearby calling 911, starting CPR, and using an AED as soon as possible. Having a written and well-practiced cardiac emergency response plan in place will increase the chance of survival for the SCA victim.
